PRIME VIDEO CONTENT ANALYSIS DASHBOARD

A Power BI Business Intelligence Project Report

Prepared by: Shivendra N. Srivastava

BBA Business Analytics Student | Aspiring Data Analyst

This report documents an independent analysis of a Prime Video content dataset for learning and portfolio development. It is not affiliated with Amazon Prime Video.

1. Project Overview

This project uses Microsoft Power BI to explore a Prime Video content catalog. The dashboard presents high-level metrics and visual summaries to help users examine the distribution of movies and TV shows, ratings, genres, release-year patterns, and country-wise availability.

The goal is to turn raw catalog data into clear visual insights that can be explored through an organized dashboard.

2. Project Objectives

• Analyze the distribution of movies and TV shows.

• Explore content availability across countries.

• Identify the most common genres and categories.

• Examine content ratings and audience classifications.

• Analyze release patterns over the years.

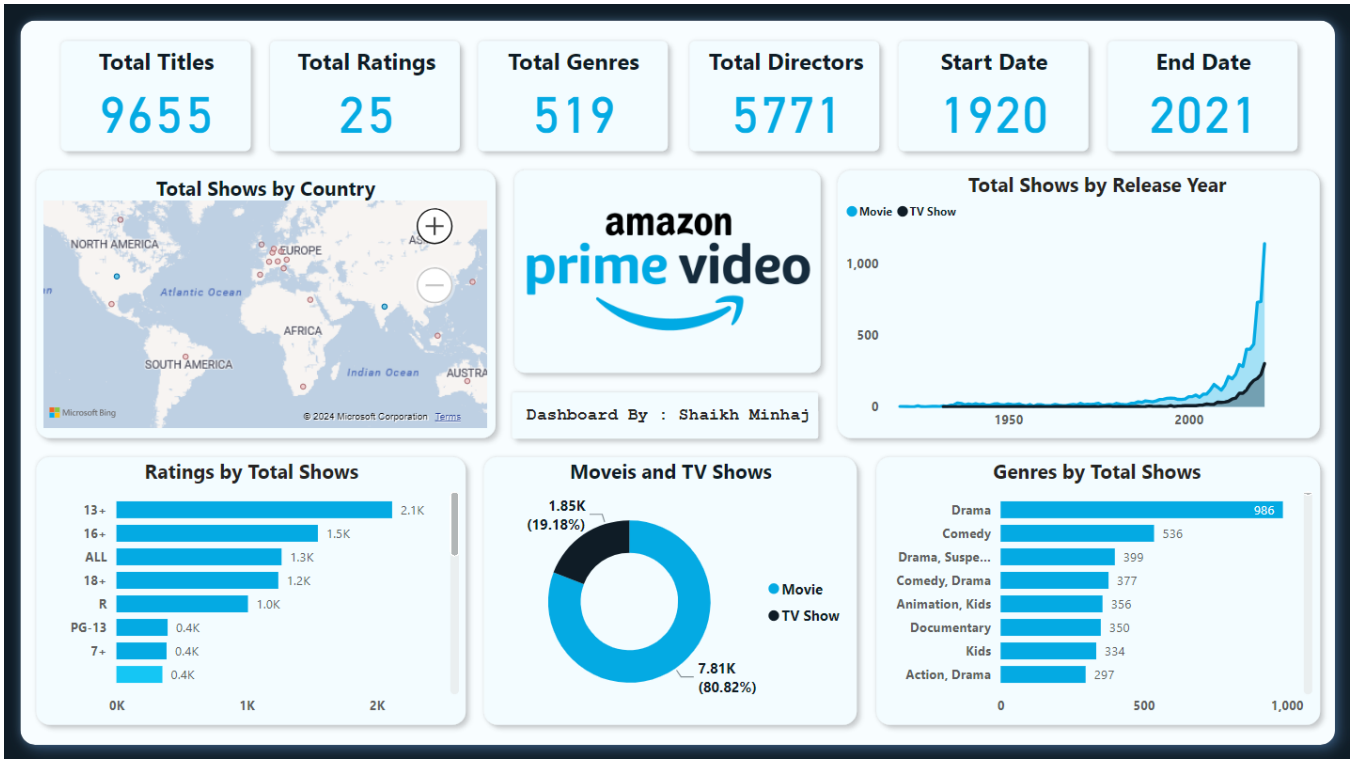

• Present the findings in an interactive dashboard.

3. Tools and Technologies

Tool / Technology	Purpose
Power BI Desktop	Dashboard creation, report layout, and visual analytics.
Power Query	Data cleaning, transformation, and preparation.
DAX	Measures and calculated metrics used in analysis.
Data visualization	Cards, charts, maps, and other visual elements.

4. Dashboard Overview

The dashboard screenshot supplied with the project contains KPI cards and visuals for the content catalog. The visible cards show total titles, ratings, genres, directors, and the earliest and latest dates shown. Charts summarize ratings, movie-versus-TV-show share, genres, release-year trends, and country-wise distribution.

Dashboard components visible in the supplied screenshot

Component	What it communicates
KPI cards	High-level catalog counts and date range.
Country map	Geographical distribution of titles.
Release-year line chart	How the number of titles changes across release years.
Ratings bar chart	Counts of titles by audience rating category.
Movie / TV Show doughnut chart	Comparison of the two content types.
Genre bar chart	Most frequent genre labels in the catalog.

5. Dataset Summary

The supplied CSV contains **9,668 rows** and **12 columns**. The fields below were read from the uploaded dataset.

Columns: show_id, type, title, director, cast, country, date_added, release_year, rating, duration, listed_in, description

Sample records

show_id	type	title	director	cast
s1	Movie	The Grand Seduction	Don McKellar	Brendan Gleeson, Taylor Kitsch, Gordon Pinsen
s2	Movie	Take Care Good Night	Girish Joshi	Mahesh Manjrekar, Abhay Mahajan, Sachin Khede
s3	Movie	Secrets of Deception	Josh Webber	Tom Sizemore, Lorenzo Lamas, Robert LaSardo,
s4	Movie	Pink: Staying True	Sonia Anderson	Interviews with: Pink, Adele, Beyoncé, Britne
s5	Movie	Monster Maker	Giles Foster	Harry Dean Stanton, Kieran O'Brien, George Co

The dashboard screenshot displays 9,655 total titles, 25 rating labels, 519 genre labels, 5,771 directors, and a displayed date range from 1920 to 2021. These values are transcribed from the screenshot and have not been independently recalculated from the PBIX model.

6. Analysis Areas

Content type: Compares movies with TV shows to show the composition of the catalog.

Genre: Identifies common genre labels and helps reveal the types of content represented.

Release trends: Shows the distribution of titles across release years and makes changes over time visible.

Ratings: Summarizes audience classification labels and their frequency.

Geography: Uses a map to show country-wise content distribution where country information is available.

7. Project Workflow

Step 1 — Load data

Import the Prime Video CSV dataset into Power BI Desktop.

Step 2 — Inspect and clean

Review data types, blanks, duplicates, inconsistent labels, and fields needed for analysis using Power Query.

Step 3 — Prepare the model

Set appropriate data types and relationships if multiple tables are used.

Step 4 — Create measures

Use DAX for relevant counts and other summary metrics, ensuring that each measure matches the intended definition.

Step 5 — Build visuals

Add KPI cards, map, bar charts, line chart, and doughnut chart based on the project objectives.

Step 6 — Arrange dashboard

Use consistent alignment, readable titles, and a restrained color palette.

Step 7 — Validate

Check that chart values, totals, filters, and labels are consistent with the dataset and intended definitions.

Step 8 — Save and present

Save the PBIX project and export the report to PDF for sharing or submission.

8. Key Insights from the Supplied Dashboard

The dashboard visually emphasizes the movie-versus-TV-show split, rating distribution, common genres, country distribution, and release-year trends. The screenshot's doughnut chart labels show approximately 7.81K movies (80.82%) and 1.85K TV shows (19.18%). The genre chart shows Drama as the largest visible category (986), followed by Comedy (536). These are visual readings from the screenshot, not a fresh calculation from the underlying Power BI model.

9. Business Value

The dashboard illustrates how BI tools can make a content catalog easier to explore. Viewers can quickly review the mix of content, identify common genre labels, inspect ratings, and observe release patterns. Such analysis can support catalog exploration and presentation, but the dataset alone does not establish audience demand or business performance.

10. Conclusion

The Prime Video Content Analysis Dashboard demonstrates the use of Power BI for data preparation, metric presentation, and visual analysis. It combines summary cards, categorical charts, a time trend, and a geographical view in one report. The project provides practical exposure to data cleaning, DAX-based metrics, dashboard design, and communicating findings through visual storytelling.

11. Viva / Presentation Notes

What is the project?
It is a Power BI dashboard project that analyzes a Prime Video content dataset using KPI cards, charts, and a country map.

Why did you choose Power BI?
Power BI supports data transformation, calculations, interactive reports, and visual dashboards in one environment.

What does the dashboard show?
It summarizes total titles, ratings, genres, directors, date range, content type, release-year trends, rating distribution, genres, and country-wise distribution.

What is Power Query?
Power Query is used to connect to data and clean or transform it before analysis.

What is DAX?
DAX (Data Analysis Expressions) is a formula language used in Power BI for measures and calculated columns or tables.

What is a KPI card?
A card displays a key metric prominently, such as a total count or a date.

What is the purpose of the map?
It provides a geographical view of title distribution by country.

What could be improved?
Add slicers for release year, country, genre, and content type; improve labels for long genre names; and validate all metrics against the source data.

Data-source note:
This is an independent learning and portfolio project and is not affiliated with Amazon Prime Video.
